AT Commands for HT32SX

1 ABOUT THIS APPLICATION

The AT Commands for HT32SX is an **EXAMPLE** application developed for a master-slave protocol, where an external module or microcontroller is used to control the entire system.

This is an open-source code. Users are responsible to change and adapt it to their specific context.

All commands must have the “;”end line character at the end of the string.

Table 1. Available Commands.

Command	Arguments	Description
AT+SEND	DOWNLINK_FLAG: Downlink flag is set to 1 to wait for a downlink. PAYLOAD: Payload that will be sent to the SigFox Network. It must be less or equal than 12 bytes.	Send a payload to the SigFox Network. Before calling this function, it is necessary to call the AT+CFGRCZ first. Example 1: <code>AT+SEND=1:AAAAAAA;</code> (Wait for a downlink). Example 2: <code>AT+SEND=0:AAAAAAA;</code> (Do not wait for a downlink). <i>It is recommended to close Sigfox Library after using this command (AT+CLOSE;).</i>
AT+CFGRCZ	RCZ: RC value corresponding to the SigFox region where the device is going to operate in.	Open SigFox library according to the region. Returns 0 if ok. Example 1: <code>AT+CFGRCZ=2;</code>
AT+MONARCH	RCZ: RC beacon expected (in order to scan every region available, the RCZ value should be 127). Minutes: Timeout. (It is recommended to use at least 6 minutes).	Scan a Monarch Beacon and returns by a serial terminal, the region founded. The library must be closed before use this command (command AT+CLOSE). Example 1: <code>AT+MONARCH=2:6;</code> (scan only RC2 beacons). Example 2: <code>AT+MONARCH=127:6;</code>
AT+STPMONARCH	None	Stops an already running Monarch Scan. Returns 0 if ok. Example: <code>AT+STPMONARCH;</code>
AT+CLOSE	None	This command closes the SigFox library (Free the allocated memory of SIGFOX_API_open and close RF). Returns 0 if success. Example: <code>AT+CLOSE;</code>

	APPLICATION NOTE 06, iMCP – HT32SX		iMCP, app note
	Application Note	01/29/2021	V 2.0

AT+RESET	None	Resets the MCU. Example: <i>AT+RESET;</i>
AT+STOP	None	Makes the MCU enters in stop mode. Example: <i>AT+STOP;</i>
AT+DEEPSLEEP	None	Makes the MCU enters in deep sleep mode (calls stop mode and turn off most of peripherals, keeping on only the USART). Example: <i>AT+DEEPSLEEP;</i>
AT+WKP	None	Wake up the MCU after a stop or deep sleep mode. Example: <i>AT+WKP;</i>
AT+SWITCHPA	PA_Flag: 1 to enable and 0 to disable.	Turn on or turn off PA. Example 1 (turning on): <i>AT+SWITCHPA=1;</i> Example 2 (turning off): <i>AT+SWITCHPA=0;</i>
AT+SWITCHBOOST	Boost_Flag: 1 to enable boost mode and 0 to disable.	Turn on or turn off S2LP boots mode. Example 1 (turning on): <i>AT+SWITCHBOOST=1;</i> Example 2 (turning off): <i>AT+SWITCHBOOST=0;</i>
AT+REDUCEPOWER	Power_value: Reduce factor	Reduces the output power of the transmitted signal. (reduction*0.5dB against the actual value). Example: <i>AT+REDUCEPOWER=-27;</i>
AT+FREQOFFSET	Offset: Frequency offset in Hz as an integer.	Sets the RF frequency offset in Hertz. Example: <i>AT+FREQOFFSET=1200;</i>
AT+RSSIOFFSET	Offset: RSSI offset as an integer in dB.	Sets a RSSI offset. Example: <i>AT+RSSIOFFSET=-17;</i>
AT+LBTOFFSET	Offset: Integer representing LBT offset in dB.	Set an offset (dB) for turning the LBT mechanism. Example: <i>AT+LBTOFFSET=0;</i>

- **Payload data type:**

The default payload data consists of hexadecimal values.

Payload example with hexadecimal values:

AT+SEND=0:0123456789ABCDEF01234567;

If there is a need to send ASCII data, the user should set a new define symbol before compile the code again:

	APPLICATION NOTE 06, iMCP – HT32SX		iMCP, app note
	Application Note	01/29/2021	V 2.0

1. Click “Project -> Properties”:

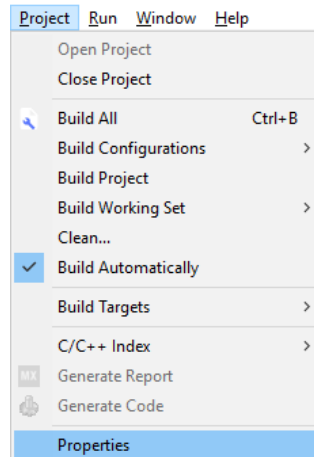

Image 1 – Project tab.

2. Click “C/C++ Build -> Settings”, select “Tool Settings” tab and click on the icon to add a new define symbol:

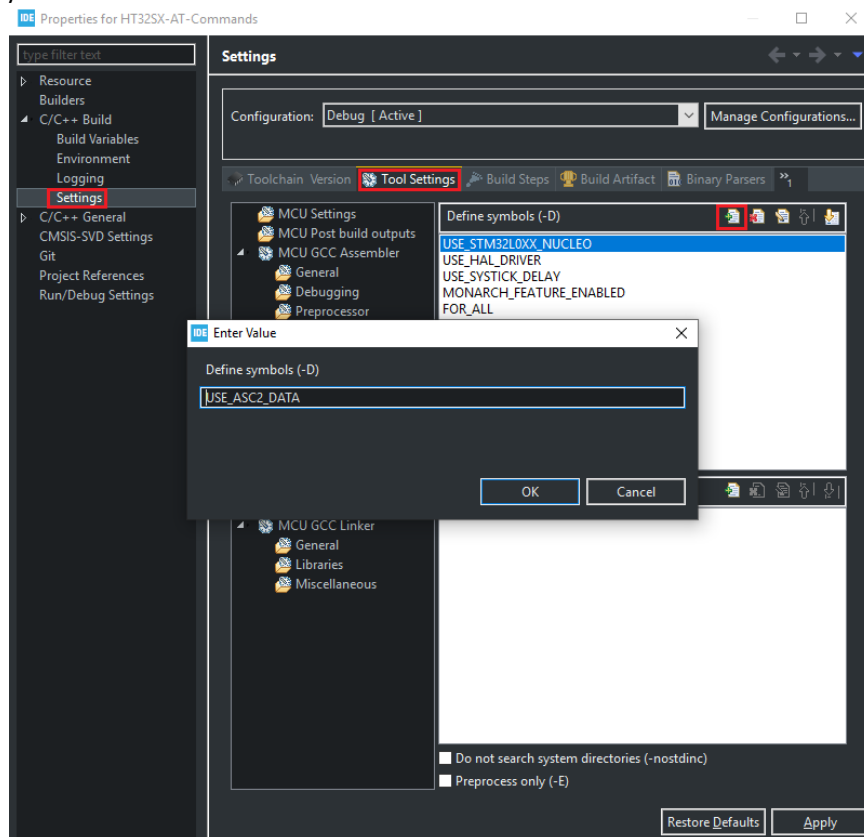

Image 2 – Project properties.

3. Write `USE_ASC2_DATA` and click on *Apply* to save all changes.

2 DEVELOPMENT SETUP

- GIT (for Windows, git-scm.com is recommended).

	APPLICATION NOTE 06, iMCP – HT32SX		iMCP, app note
	Application Note	01/29/2021	V 2.0

- ST-LINK Utility or STM32CubeProgrammer.
- STM32CubeIDE.
- RS232 terminal (Termite is recommended).
- HT32SX chip.
- An antenna for your respective Sigfox RC Zone or a multiband antenna.
- A FTDI (USB-Serial converter).

3 EXECUTING WITH A SERIAL TERMINAL

Termite is recommended.

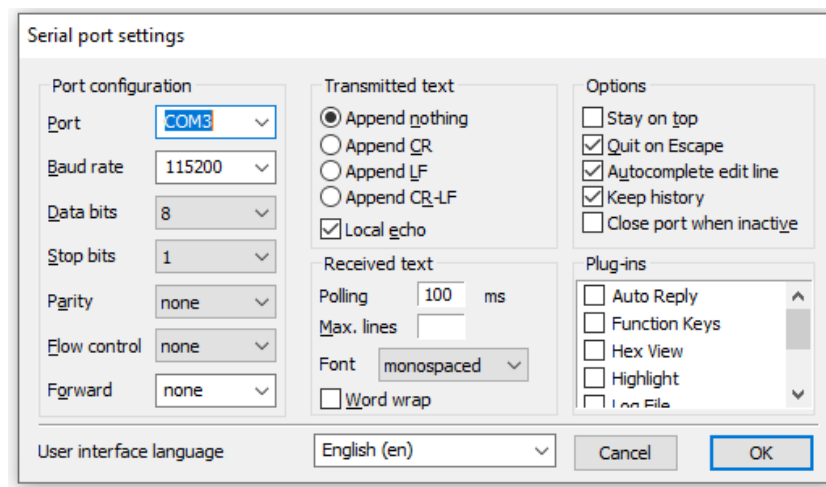

Image 3 – Termite configuration.

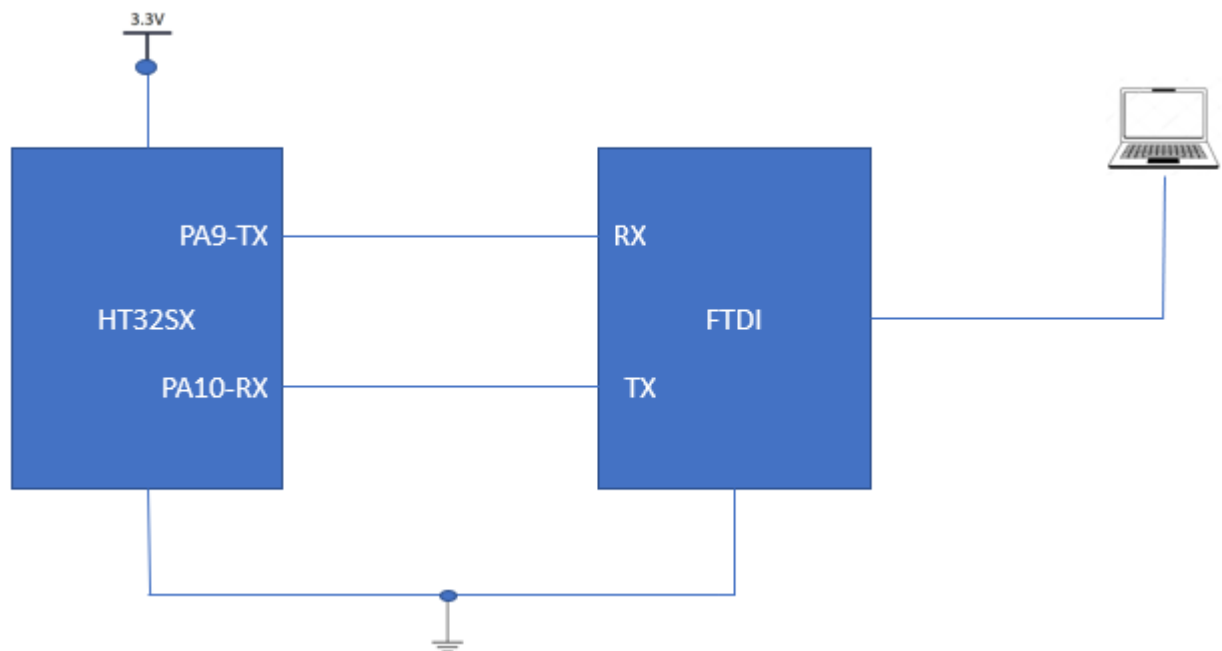

Image 4 – Validation setup.

4 SLEEP AND WAKE-UP MECHANISM

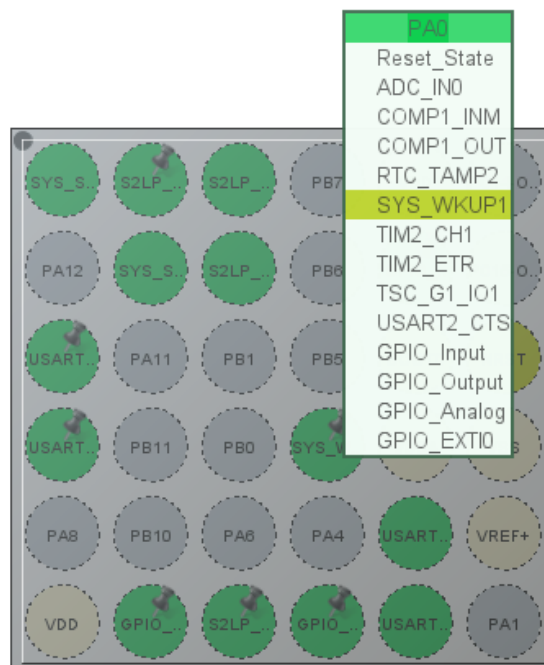

The AT Commands for HT32SX was made to wake-up from deep sleep mode using only the USART1 RX. It means that after an *AT+DEEPSLEEP;* command, a simple *AT+WKP;* should be enough to awake it again. Even though it seems convenient, keeping USART awake during the whole deep sleep process will increase the current consumption to around 90 μ A. In cases where the power consumption is critical, it is recommended to change the deep sleep routine to use the Standby Mode instead of Stop Mode, awaking your device through Wake-up Pin (PA0). These changes will decrease the current consumption to about 3 μ A.

Changing the AT Commands to wake-up using WKP_PIN:

1. Open the AT Commands project in STM2CubeIDE and double click the .ioc file to open the GUI tool.

2. Find the PA0 pin, click on it and select SYS_WKUP1 option:

3. Go to *Project -> Generate Code* to save all changes and generate the related code.
4. Then go to *HT_API -> Src -> HT_mcu_api.c* and change the *HT_McuApi_enterDeepSleepMode* function as shown in the example below:

	APPLICATION NOTE 06, iMCP – HT32SX		iMCP, app note
	Application Note	01/29/2021	V 2.0

```
void HT_McuApi_enterDeepSleepMode(void) {
    /*Disable all used wakeup sources: Pin1(PA.0)*/
    HAL_PWR_DisableWakeUpPin(PWR_WAKEUP_PIN1);

    /*Clear all related wakeup flags*/
    __HAL_PWR_CLEAR_FLAG(PWR_FLAG_WU);

    /*Re-enable all used wakeup sources: Pin1(PA.0)*/
    HAL_PWR_EnableWakeUpPin(PWR_WAKEUP_PIN1);

    FEM_Operation(FEM_SHUTDOWN);
    S2LPShutdownEnter();

    HAL_PWR_EnterSTANDBYMode();
}
```

5 HOW TO SEND A FRAME TO THE SIGFOX NETWORK

1. First, your device must be configured to its current Sigfox Region. An example configuring to the RC2 could be like:

```
AT+CFGRCZ=2;
```

If you do not know what your Sigfox Region is, please have a look at [THIS](#) document to learn a little bit more about it.

2. Now you can send your payload using the AT+SEND command. Example:

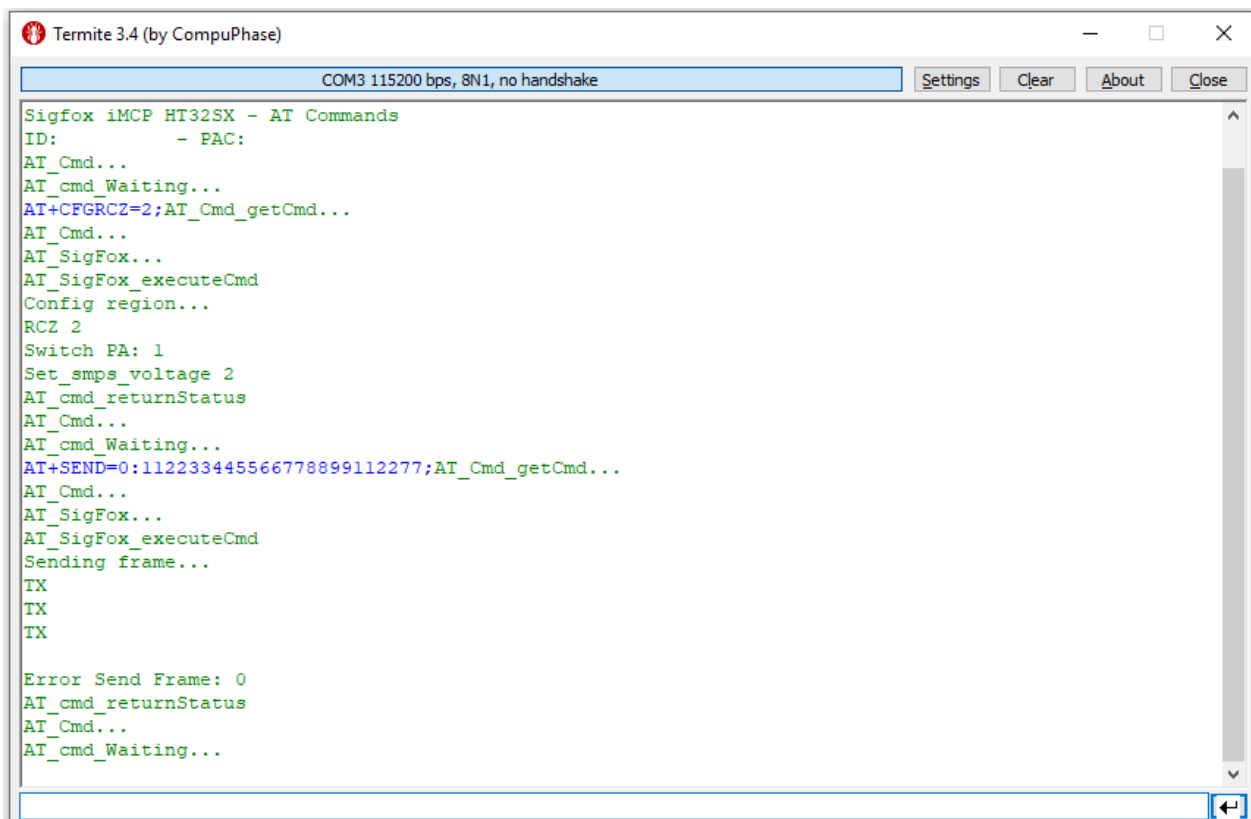

```
AT+SEND=0:112233445566778899112277;
```

	APPLICATION NOTE 06, iMCP – HT32SX		iMCP, app note
	Application Note	01/29/2021	V 2.0

6 RESULTS

Some results are expected running this application. It is recommended to use a serial terminal to check if the commands are being executed (Termite was used in these examples).

1. Sending a frame to the Sigfox Network:

```

Termite 3.4 (by CompuPhase)
COM3 115200 bps, 8N1, no handshake

7 EXTRA DOCUMENTATION

Datasheets and other firmware examples can be found at the [HT32SX Repository](#).

Basic [Firmware Examples](#).

Please access our [FAQ](#) to learn extra information about the Sigfox Network, such as registration of a new device and a new user on Sigfox Backend.

8 REFERENCES

For additional information about SigFox libraries designed by ST Microelectronics, please refer to the UM2173 document (note: the function names still the same, but the code was adapted to use in the iMCP design, so it is different from the one distributed by ST).
